

CASSIDY BRIDGES

📍 Denver, Colorado, USA ✉ cassidybridges@gmail.com in [in/cassidy-bridges-tech](https://in.cassidy-bridges-tech) 🌐 off-by-some.github.io/web/

SUMMARY

Software Engineering Leader with 12+ years of experience building scalable systems and high-performance teams. Specializing in React, Node.js, Go, Python, and cloud infrastructure.

EXPERIENCE

Senior Engineering Consultant

Stealth Startup

February 2026 - Present, Remote

- Led technical discovery and migration planning for a large portfolio of AWS Lambda services, defining runtime strategy, dependency risk, rollout sequencing, and acceptance criteria.
- Designed a safer serverless release model using versioned deployments, stable aliases, staged environment promotion, health monitoring, and rollback paths.
- Drove technical change management across engineering, QA, and delivery leadership, translating infrastructure risks into concrete decisions, milestones, validation plans, and release criteria.
- Built a system inventory and dependency map spanning serverless services, shared libraries, source repositories, architectures, and invocation paths to expose hidden blast radius before migration.
- Diagnosed production failures across distributed, event-driven workflows by tracing data through APIs, serverless functions, application logs, databases, and upstream and downstream systems.

Senior Software Engineer

Scribe

April 2023 - December 2024, Remote

- Led performance overhaul that knocked CPU peaks from 99% to 15% and cut memory use by 83%, dramatically boosting developer velocity and enabling enterprise-scale workloads.
- Built "Bug Buddy," an AI-powered triage assistant that slashed manual triage time by 72% and cut downstream bug volume by 90%.
- Architected and executed a multi-team refactor, removing 15,000+ lines of legacy code and migrating the entire front end to TypeScript.
- Rebuilt the front-end API layer, cutting API calls by 80% and speeding time-to-render by 53%, all without pausing active feature work.
- Designed democratic decision processes and living documentation so engineering teams could ship and review features faster together.

Senior Software Engineer II

Green Bits Inc & Dutchie

April 2017 - December 2022, Remote

- Built the first white-labeled React dispensary menu, cutting manual inventory updates and custom branding chores by 40+ hours/week.
- Performed load testing, complex query analysis, and chaos engineering to ensure the company's systems were resilient to 400% traffic surges.
- Implemented redundant data storage and replication alongside failover strategies, ensuring data integrity and reliability across multiple data centers.
- Owned the DevEx team's product roadmap, working with other teams to distill criteria into actionable items and ensure the team was always shipping high-value features.
- Engineered pre-production and staging environments with feature branches and Kubernetes, eliminating QA environment wait times and accelerating inefficient test cycles by over 80%.

Software Engineer

UpGuard

April 2017 - September 2017, Mountain View, California

- Contributed to our vulnerability-scanning engine, adding support for diverse machine environments to broaden security coverage and strengthen proactive detection.
- Prototyped the phased migration from Angular 1 to React, replacing monolithic controllers with modular and isolated components, improving maintainability.
- Overhauled the end-to-end tests using best practices found within TDD, BDD, and E2E testing, reducing total suite runtime by six hours and catching regressions far earlier.
- Containerized development environments with Docker to mirror staging, reducing setup friction and improving release consistency.

Front-End Engineer

Import.io

August 2016 - April 2017, Los Gatos, California

- Established foundational engineering workflows, including unit and E2E tests, structured ticketing, and sprint estimates, to transform a fragile codebase into a maintainable, predictable system.
- Architected a high-performance spreadsheet engine with live formulas and virtual rendering, eliminating manual scripts and saving users hundreds of hours.
- Designed and implemented the full Angular 1 to React migration, reducing the JavaScript bundle by 45% and cutting initial load times by 60%, all without a single customer-facing regression.
- Mentored junior developers through pair programming and code reviews, embedding React best practices and lifting the entire team's frontend expertise.

Full-Stack Developer / CTO

LaunchBadge LLC

February 2015 - September 2016, Sacramento, California Area

- Built the real-time mobile app alongside Go, Python, and Node.js backends, laying the foundation for a product that generated \$1.2M+ in bookings.
- For six weeks, facilitated cross-functional standups, set OKRs, and prioritized features, cutting project defects and ramping up team alignment.
- Owned the product roadmap, balanced feature priorities against resource and budget constraints, and kept multiple projects on time and on budget.
- Introduced agile practices, including sprint planning, backlog grooming, and retrospectives, that improved predictability and boosted delivery velocity.

PROJECTS

FynX

github.com/off-by-some/fynx

- Designed FynX as a reactive incremental-computation library for Python to keep application state synchronized with changing inputs over time.
- Implemented dependency graph recomputation that isolates and recalculates only affected values while keeping unobserved work lazy and notifying subscribers.
- Built the library with zero core dependencies and compatibility with ordinary Python functions, drawing inspiration from MobX and functional reactive programming.
- Enabled incremental adoption around single computations without requiring project-wide architectural rewrites.

Homeworld

github.com/off-by-some/homeworld

- Developed a transactional runtime for personal computing environments that centralizes shell configurations, bin scripts, and dotfiles into a single Git repository.
- Streamlined multi-machine provisioning and synchronization using automated update workflows across Linux and macOS systems.
- Implemented an off-to-side transactional build model that prevents broken installations from affecting working environments and supports instant rollbacks.
- Authored the platform using POSIX shell with rigorous testing across sh, dash, and ash shells.

Dogescript

github.com/dogescript/dogescript

- Maintained Dogescript, an esoteric programming language compiler that translates Doge-meme syntax into valid, runnable JavaScript.
- Contributed to core language design, compiler architecture, and the modernization of the project's build and tooling stack.
- Built comprehensive testing suites and established robust testing conventions from the ground up for reliable compiler output.

TRELLIS-BOX

Microsoft · github.com/off-by-some/TRELLIS-BOX/tree/trellis-2

- Containerized Microsoft's TRELLIS image-to-3D pipeline for local execution on consumer hardware without complex dependency friction.
- Optimized memory usage for 12GB GPUs using FP16 mixed precision on v1, along with lazy model scheduling and flow-block offload on v2.
- Bundled both the original Streamlit app with automatic GLB export and the newer O-Voxel/PBR Gradio pipeline into reproducible Docker environments.
- Utilized Docker, NVIDIA CUDA, and the NVIDIA Container Toolkit to streamline local 3D model generation workflows.

SKILLS

Frontend Architecture: React, Webpack, SCSS, Redux, Jest, TypeScript, MobX, Storybook, Next.js, GraphQL, Tailwind, Vite, Svelte

Backend Systems: PostgreSQL, Python, Ruby, Node.js, Django, Ruby on Rails, Go, Redis, Apache Kafka, Elasticsearch, LangChain

Cloud & DevOps: Bash, Git, CI/CD, Docker, AWS, Kubernetes, Helm, Datadog, Terraform, Locust

Leadership & Strategy: Web Accessibility (WCAG, ARIA), Documentation, Software Architecture, Project Management, Mentoring, Team Leadership, Product Strategy
